

## Week 11 Research

By: Patrick Corcoran

The Fetch() method is an API interface in JavaScript. It is promise based allowing for asynchronous operation of the code, which can be handy if you are working over a less than ideal connection. It is a method that provides an easy way to access resources and requests over the internet. It integrates some more advanced HTTP protocols such as CORS among others.

Traversing the DoM in JQuery is a way of moving through the website elements to find certain elements based upon their relation to others. You could think of the DoM as a tree if you start at the top, you can move up or down the tree with jquery by referencing parent or child nodes. Like a Div could be a parent and have a child Paragraph in it. You could target the div and easily get to the paragraph by amending your target to the child.
